INSTALLATION GUIDE

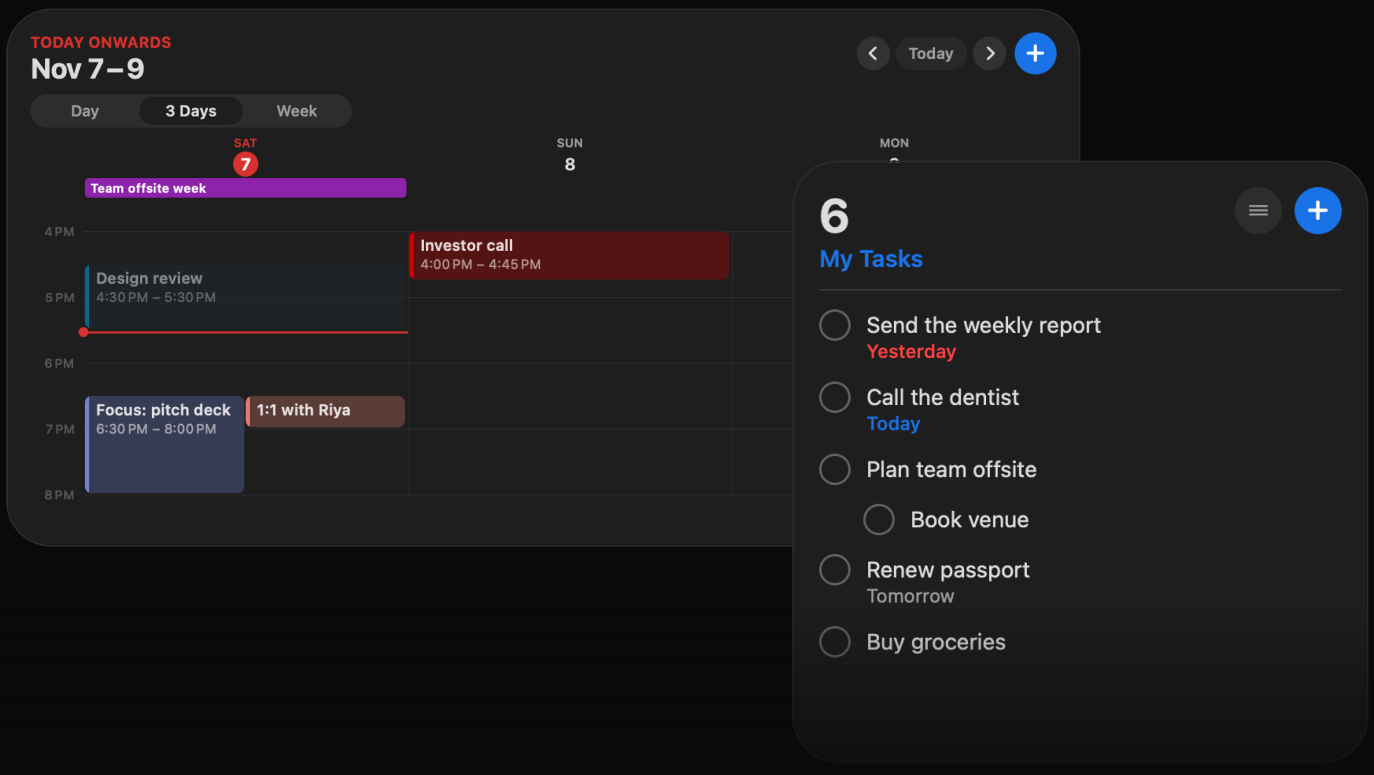

Installing Glance takes five minutes.

Your Google Calendar and Google Tasks, on your Mac's desktop. This guide walks you through every screen, including two warnings you'll see along the way and why they're nothing to worry about.

MACOS 15 OR LATER

APPLE SILICON AND INTEL

FREE DURING EARLY ACCESS

BEFORE YOU START

A word about early access.

Glance is new, and it's free while it's in early access. It's made by an independent developer, not a big company, and some of the official paperwork that big apps have is still in progress. You'll notice that in two places:

WARNING 1 · YOUR MAC

"Apple could not verify Glance"

Why: Apple asks developers to sign their apps with a paid certificate. Glance hasn't done that yet, so macOS can't tell who made it and asks you to decide.

For you: you confirm once, and your Mac never asks again. If you install with the one-line command on page 3, you won't see this at all.

WARNING 2 · GOOGLE

"Google hasn't verified this app"

Why: every app that reads Google Calendar or Tasks goes through Google's review, which takes a few weeks. Until Glance is approved, Google shows this screen to everyone.

For you: click **Advanced**, then **Go to Glance**. Google's word "unsafe" there is used for every app still in review. It doesn't mean anything was found wrong.

What keeps you safe in the meantime

Google handles your password
You sign in on Google's own page in your browser. Glance never sees or stores your password.

No Glance servers
Your events and tasks travel straight between Google and your Mac. Nothing passes through anyone else's computer.

You can undo it anytime
Remove Glance's access in one click at myaccount.google.com/permissions.

Every release is public
Downloads come straight from GitHub, and every version and change is listed there for anyone to see.

Both warnings will go away. Google's review is under way, and Apple signing is planned before Glance leaves early access. When that happens, the app updates itself and you won't need to do anything.

STEP 1 · INSTALL

The easy way: one line.

This is the quickest way, and it skips the Mac warning entirely. You don't need to know anything about Terminal.

1 Open Terminal

Press `⌘ Space`, type **Terminal** and press `Return`.

2 Paste this line and press Return

Copy it from the website (it has a Copy button) or type it exactly as it is:

```
curl -fsSL https://kaizarraja.github.io/glance/install.sh | bash
```

Return ↵

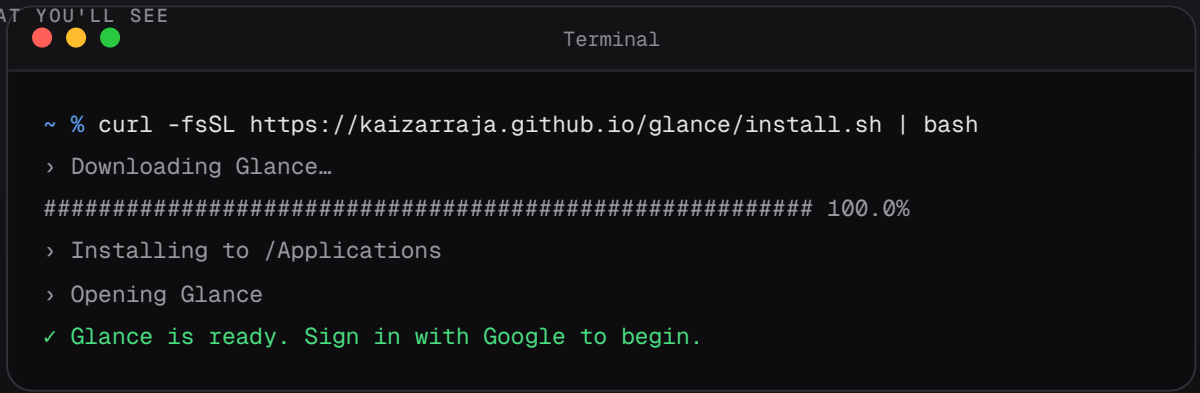

3 Type your Mac password if asked

Only some Macs ask. It's needed to put Glance in your Applications folder. While you type, nothing appears on screen. That's normal; press `Return` when done.

4 Glance opens by itself

That's it. Continue with **Step 2: Sign in** on page 5.

WHAT YOU'LL SEE

What the line does: it downloads Glance from its official GitHub page, puts it in Applications and opens it. Nothing else is installed or changed on your Mac.

Downloaded the zip instead? Turn the page.

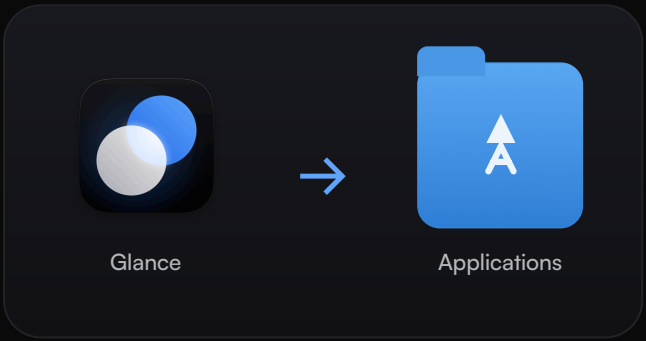

STEP 1 · INSTALL (OTHER WAY)

If you downloaded the zip.

You'll confirm once that you trust Glance. It takes about a minute.

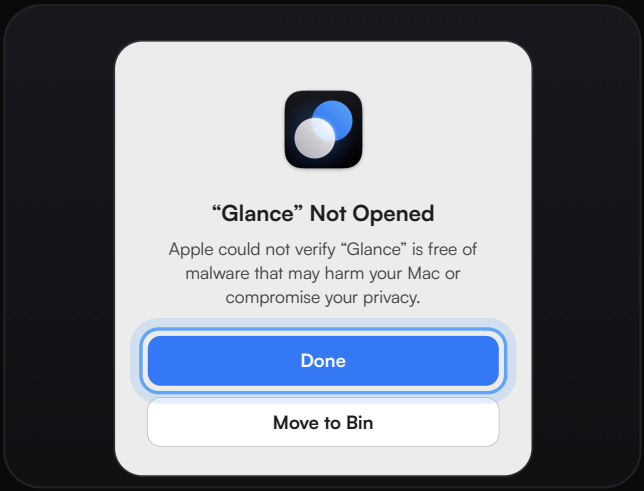

1 Drag Glance to Applications

Open the downloaded folder, then drag **Glance** onto **Applications** in the Finder sidebar.

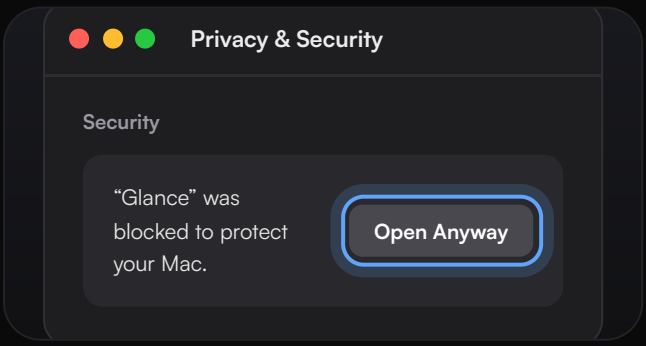

2 Open it, then click Done

macOS says it couldn't verify Glance. That's warning 1 from page 2. Click **Done**, not Move to Bin.

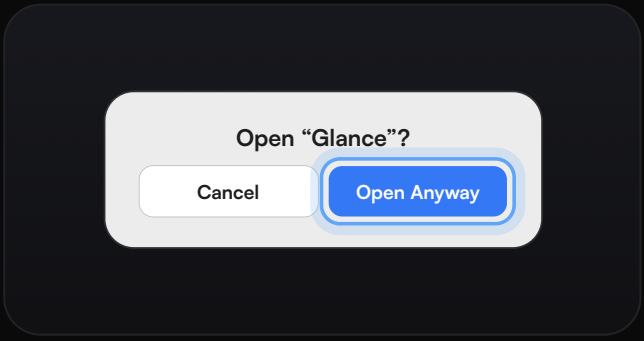

3 Click Open Anyway

Open **System Settings → Privacy & Security**. Scroll down to **Security** and click **Open Anyway**.

4 Confirm with your password

Click **Open Anyway** once more and enter your Mac password or use Touch ID. Glance opens, and your Mac remembers your choice.

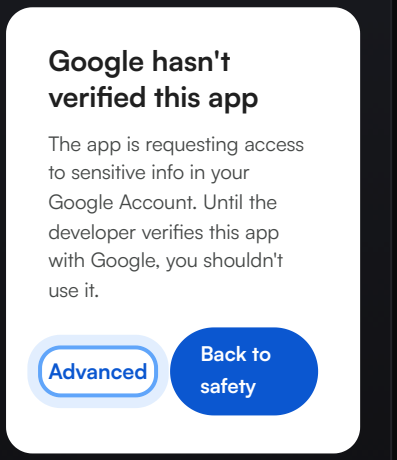

? **Does your Mac say "Glance is damaged and can't be opened"?** It isn't damaged: that's an older wording of the same warning. Use the one-line install on page 3 instead, and it will open normally.

STEP 2 · SIGN IN

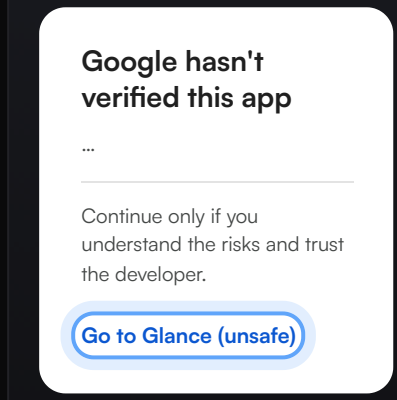

Connect your Google account.

Click **Sign in with Google** in Glance. Your browser opens Google's own sign-in page. Choose your account, then:

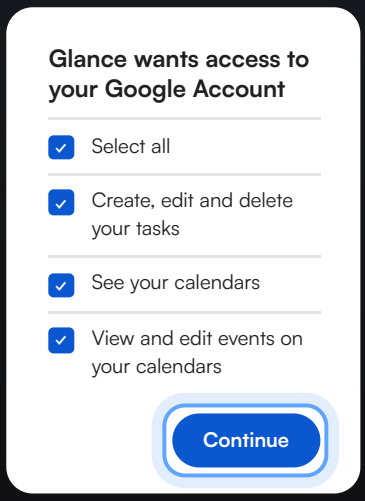

1 Click Advanced

2 Click Go to Glance

3 Tick every box

4 Go back to Glance

The browser tab says you can close it. Glance finishes signing in and shows your calendars and task lists within a few seconds.

About "unsafe": Google shows this word for every app it hasn't finished reviewing, however well-behaved. Glance's review is under way.

Tick all the boxes. If one is left empty, the matching part of Glance (tasks or calendar) can't load. You can reconnect from Glance's Settings at any time.

Work or school account? It works if your organisation allows third-party apps.

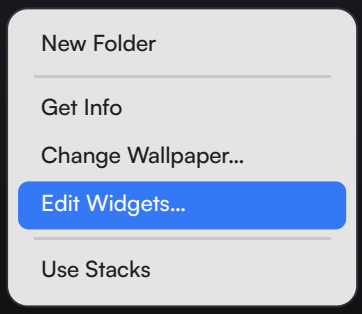

STEP 3 · WIDGETS

Put your day on the desktop.

This is the best part. Glance's widgets aren't just for looking: tick tasks, flip through days and switch between Day, 3 Days and Week right on the widget.

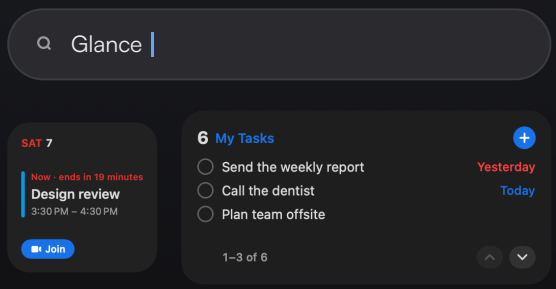

1 Right-click the desktop

Click an empty spot on your desktop with two fingers (or Control-click) and choose **Edit Widgets...**

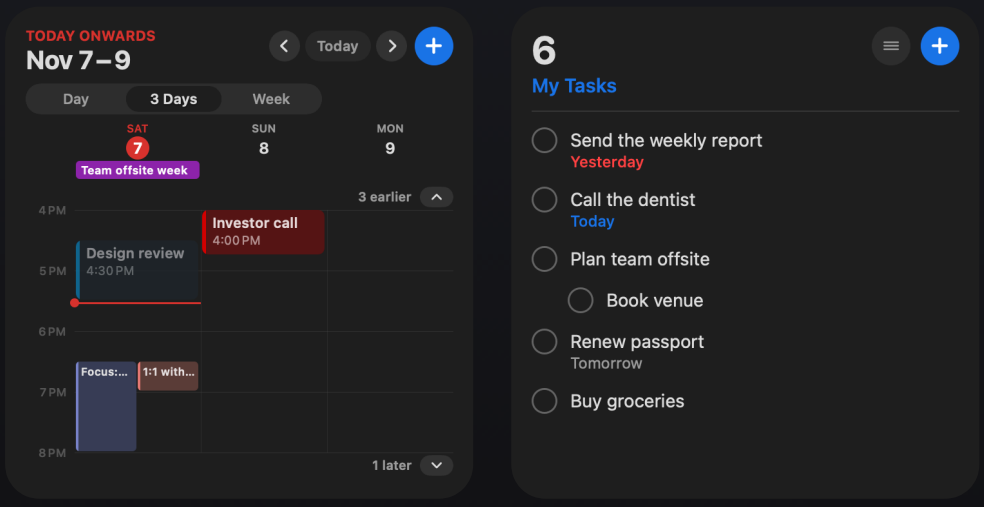

2 Search for Glance

Type **Glance** in the search box. You'll see the Tasks, Agenda and Timeline widgets in several sizes.

3 Drag the ones you like onto your desktop

Mix and match sizes. On the Tasks widget, tap the list's name to switch to your next list.

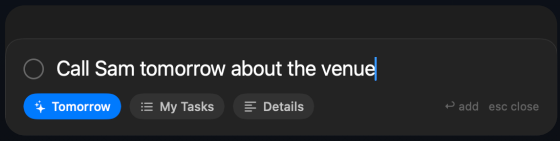

STEP 4 · MAKE IT YOURS

Two things worth knowing.

QUICK ADD

Press ^ ⌥ T anywhere

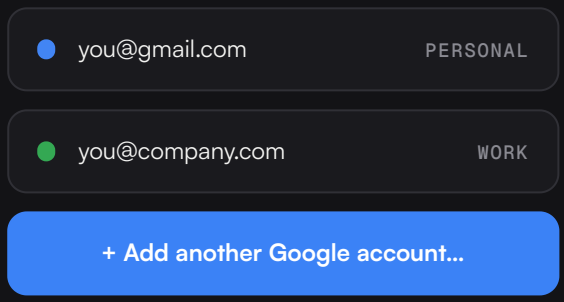

Control, Option and T, from any app. Type a task, press Return, and it's in Google Tasks. You don't need to leave what you're doing.

MORE ACCOUNTS

Work and personal, together

Open **Settings → Calendar → Add another Google account...** and all your calendars show up side by side. The same Google screens appear for each new account.

Questions

Is Glance safe to use?

Yes. The warnings are about paperwork that's still in progress, not about anything Glance does. It only talks to Google, and only for your calendars and tasks.

Is it really free?

Yes, during early access. If a paid version ever comes, early users hear first, and nothing stops working without warning.

How do I get updates?

Glance checks for new versions itself and asks before installing. You can also choose **Glance → Check for Updates...** in the menu bar.

How do I remove it?

Quit Glance, drag it from Applications to the Bin, and remove its access at myaccount.google.com/permissions.

Stuck, or have an idea?

Choose **Glance → Send Feedback...** in the menu bar, or open an issue at github.com/kaizarraja/glance/issues. Screenshots help a lot. Thanks for trying Glance early.
